## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 9455-11 was prepared by Technical Committee ISO/TC 44, *Welding and allied processes*, Sub-Committee SC 12, *Soldering and brazing materials*.

ISO 9455 consists of the following parts, under the general title *Soft soldering fluxes — Test methods*:

- *Part 1: Determination of non-volatile matter, gravimetric method*
- *Part 2: Determination of non-volatile matter, ebulliometric method*
- *Part 3: Determination of acid value, potentiometric and visual titration methods*
- *Part 5: Copper mirror test*
- *Part 6: Determination of halide content*
- *Part 8: Determination of zinc content*
- *Part 9: Determination of ammonia content*
- *Part 10: Flux efficacy tests, solder spread method*
- *Part 11: Solubility of flux residues*
- *Part 12: Steel tube corrosion test*

## Soft soldering fluxes — Test methods —

### Part 11: Solubility of flux residues

#### 1 Scope

This part of ISO 9455 specifies a qualitative method for assessing the solubility of flux residues in a selected solvent. The method is applicable to all fluxes of Type 1, as defined in ISO 9454-1.

**NOTE 1** This test gives no assurance that post-cleaning residues, which may be present in sufficiently small amounts to pass the test, will not be detrimental to the soldered assembly in the long term.

#### 2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 9455. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 9455 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 1634-1:1987, *Wrought copper and copper alloy plate, sheet and strip — Part 1: Technical conditions of delivery for plate, sheet and strip for general purposes.*

ISO 9454-1:1990, *Soft soldering fluxes — Classification and requirements — Part 1: Classification, labelling and packaging.*

#### 3 Principle

A brass test plate is fluxed, heated to soldering temperature and, after conditioning, is immersed in the selected solvent to dissolve the flux residue. The

effectiveness of the flux residue removal is indicated by the presence of a current flowing across the junction between the cleaned area and an electrical probe tip.

#### 4 Reagents and materials

##### 4.1 General

In the test use only reagents of recognized analytical quality and only distilled, or deionized, water.

##### 4.2 Acid cleaning solution

Add cautiously, with stirring, 75 ml of sulfuric acid ( $\rho$  1,84 g/ml) to 210 ml of water and mix. Cool, add 15 ml of nitric acid ( $\rho$  1,42 g/ml) and mix the solution thoroughly.

##### 4.3 Solvent

This is the solvent selected for the flux residue removal as recommended by the flux manufacturer or supplier.

**NOTE 2** The solvent to be used will vary with the flux composition.

##### 4.4 Industrial methylated spirits.

##### 4.5 Oil crayon.

**4.6 Brass test plates**, each 60 mm  $\times$  60 mm, cut from 0,5 mm thick brass sheet complying with ISO 1634-1, alloy CuZn 37, condition HA.

A 3 mm deep depression shall be formed in the centre of each test plate by means of a 20 mm diameter steel ball.

## 5 Apparatus

Usual laboratory apparatus and, in particular, the following.

**5.1 Solder bath**, containing not less than 4 kg of solder alloy, having a depth when molten of not less than 25 mm and capable of being maintained at a temperature of  $(300 \pm 10)^\circ\text{C}$ .

**5.2 Temperature/humidity oven**, capable of maintaining a temperature of  $(23 \pm 2)^\circ\text{C}$  and a relative humidity  $(50 \pm 5)\%$ .

**5.3 Power source**, 6 V d.c.

**5.4 Variable resistor**, 0 to 100  $\Omega$ .

**5.5 Milliammeter**, 100 mA d.c.

**5.6 Test probe**, consisting of a copper rod, 4 mm diameter  $\times$  50 mm long, with a palladium/silver tip 4 mm radius, fitting into a guide sleeve of non-conducting material (see figure 1). The probe shall be capable of pressing freely, i.e. under its own weight, on to the surface of the brass test plate (4.6).

## 6 Procedure

Carry out the following procedure, in triplicate, on the flux sample.

Clean two brass test plates (4.6) by immersion for 15 s in the acid cleaning solution (4.2). Rinse the test plates under running water, then in industrial methylated spirits (4.4) and dry with warm air.

Draw a 30 mm diameter circle round the depression on each test plate with the oil crayon (4.5), in order to restrict the spread of the flux during the test.

Place 0,1 ml of the liquid flux sample, or 0,05 g of the solid or paste flux sample in the depression of both test plates.

Float one of the test plates for 5 s on the surface of the solder bath (5.1), which is maintained at  $(300 \pm 10)^\circ\text{C}$ . Remove the test plate (designated "plate A") and cool to room temperature. The other test plate (designated "plate B"), which is used as a control, is not subjected to this heating stage. Condition both the test plates in the humidity oven (5.2) at  $(23 \pm 2)^\circ\text{C}$  and  $(50 \pm 5)\%$  relative humidity, for 24 h.

Within 1 h of removing the test plates from the oven, immerse them in the selected solvent (4.3) for either a) 1 min or b) 10 min. Dip the test plates in clean solvent (4.3) for 2 s and then in industrial methylated spirits (4.4) for 2 s. Dry the test plates in warm air.

Condition the test plates again at  $(23 \pm 2)^\circ\text{C}$  and  $(50 \pm 5)\%$  relative humidity in the oven (5.2) for 24 h.
